DIAGNOSED WITH PSORIASIS?

CONSIDER VOLUNTEERING IN THE ‘PAUSE’ RESEARCH STUDY
Fight back against psoriasis.

The PAUSE clinical research team in your area is seeking people who have been diagnosed with psoriasis to participate in a 2-year study. The goal of the study is to learn whether taking Stelara® (ustekinumab) followed by an investigational drug (abatacept) can help control psoriasis.

If you are between the ages of 18-65 and have been diagnosed with psoriasis for 6 months or longer, you may be eligible to participate.

Qualified participants will receive study-related exams and treatment with Stelara® (ustekinumab). They will also receive either an investigational drug (abatacept) or a placebo (an inactive liquid). All study related treatments are provided at no cost. Participants may be reimbursed for travel expenses and may receive compensation for some study visits during the course of the trial.

Contact your local PAUSE clinical center for more information:
