Taltz is the trade name for the biologic ixekizumab. It is a biologic medicine. Biologics are made from living sources such as human, animal or bacteria cells. Taltz is used to treat psoriasis and psoriatic arthritis (together called psoriatic disease).

**How effective is it?**

Taltz helps to stop inflammation in the skin, joints and tendons and reduce psoriasis and psoriatic arthritis symptoms.

A clinical trial is a research study used to determine how safe and effective a new treatment is. This often is done to compare the new treatment with a placebo (an inactive pill, liquid or powder that has no treatment value).

In clinical trials:

- 90 percent of adults with psoriasis experienced at least a 75 percent improvement after 3 months
- 71 percent of adults with psoriasis experienced at least a 90 percent improvement after 3 months
- 58 percent of adults with psoriatic arthritis experienced at least a 20 percent improvement after 6 months

Treating your psoriatic disease is important for disease management, reducing your risk for comorbidities (related health conditions) and improving your overall health and quality of life.

**Fast facts about Taltz**

- Was approved by the U.S. Food and Drug Administration for treating adults with moderate to severe plaque psoriasis in 2016 and psoriatic arthritis in December 2017
- Works by targeting the cytokine (a type of protein involved in the immune system) called interleukin 17 (IL-17)
- Is available by prescription and is given as a self-injection (a shot that you give yourself); help and training is offered for self-injections
- Is meant to be taken long-term

**Financial assistance**

Eli Lilly provides financial support and other resources for people taking Taltz. For more information, call 1-844-825-8948 or visit Taltz.com.
How does it work?
Biologics for psoriatic disease work by targeting a specific part of the immune system that is overactive.

Your immune system protects your body from illness and infections. With psoriatic disease, the immune system is overactive. This causes inflammation of the skin and speeds up skin cell growth. It also causes inflammation in joints, tendons and ligaments in psoriatic arthritis.

Who can take it?
Adults over the age of 18 with moderate to severe plaque psoriasis or psoriatic arthritis can take Taltz. Speak with your health care provider if you are pregnant or breastfeeding, or are planning to become pregnant.

Who should not take it?
You should not take Taltz if you are allergic to Taltz or its inactive components.

What are the risks?
There is the risk for an allergic reaction and an increased risk for infections. This is because the treatment is causing some immunosuppression (lowering the function of the immune system). If you notice any sign of infection, speak with your health care provider right away. Before starting Taltz, you will be screened for latent (non-active) tuberculosis (TB). Avoid receiving live vaccinations while taking Taltz.

There have been rare reports of inflammatory bowel disease. Speak with your health care provider if you develop a fever or chest pains that do not go away, shortness of breath, sudden weight gain or swelling of your ankles or feet.

Common side effects
In clinical trials, the most common side effects associated with Taltz are:

- **Injection site reactions**: 17% of patients with psoriasis treated with Taltz reported injection site reactions (compared to 3% of patients treated with a placebo)

- **Infections such as the flu, sinus infections or upper respiratory infections**: 14% of patients with psoriasis treated with Taltz reported infections (compared to 13% of patients treated with a placebo)

- **Nausea**: 2% of patients with psoriasis treated with Taltz reported nausea (compared to 1% of patients treated with a placebo)

- **Fungal infections**: 2% of patients with psoriasis treated with Taltz reported fungal infections (compared to less than 1% of patients treated with a placebo)

These side effects happen most often after the first dose and may decrease after additional doses or over time. The side effects are generally mild and do not cause most people to stop taking Taltz.

Keep in mind that side effects observed in clinical trials may not predict actual rates of side effects.

What should I do next?

- Speak with your health care provider about whether Taltz is appropriate for you.
- Contact our Patient Navigation Center to find providers, discuss treatments and get help with accessing treatments (find contact information below).
